

Payments reconciliation — June 2026 (Lumo Wellness)

Conclusions

The reconciliation is built in DuckDB with a dbt pipeline (dbt-duckdb): layers raw → staging → intermediate → marts. SQL lives in manual/dbt/models/, the final tables are exported to manual/out/marts/*.csv. Each provider is reconciled against the engine in its own table int_recon_<psp>, one row per pair "engine record ↔ provider record" with a cause and a USD difference. Summaries are collected in marts.recon_summary (provider × cause), marts.recon_summary_by_psp, marts.recon_totals (identity and residual) and marts.fee_summary (fees against contract). 369 tests, no failures, 5 warnings on known duplicates in the raw files. The difference is always provider minus engine; a plus means the provider has more.

June 2026 revenue is 335,668.57 USD in the engine and 134,768.91 USD at the providers. Almost the whole gap, 200,679.44, is three dLocal payments that the engine recorded with an FX rate of 1: local amounts in BRL, MXN and COP became dollars. Without this error the engine gives 134,989.13 (after correcting all 16 discrepancy lines June revenue is 134,794.82, table marts.revenue_corrected_by_psp, rules in ENGINE_CORRECTED.md), and 220.22 of real discrepancies remain across the five providers: chargebacks and refunds the engine never received, payments booked at the authorised instead of the captured amount, disputed statuses, duplicated export rows and the month boundary. All 25 mismatching pairs are assigned to a cause; there is no unexplained residual. Google Play reconciles to the cent. Adyen and Google Play fees are on contract overall, but on eight payments the providers charged double the rate; the overpayment is 1.72 USD and 9.00 USD.

Action items

Action items, by money at stake:

- Engine: forbid an FX rate of 1 for any currency other than USD, add a test of fx_rate_applied against the rate table. This is 200,679.44.
- Engine: ingest chargebacks from PayPal and Adyen; today they do not arrive at all. 130.15 USD for the month.
- Engine: take the Settled amount from Adyen, not Authorised; partial captures are booked at the full amount. 40.36.
- Engine: sync statuses with the provider: pending older than an hour, Refused, IN_MEDIATION, refunds without a record. 69.33 by absolute value across four cases.
- Rate table: remove the first BRL row for 2026-06-10 (0.185352, superseded by the 0.190542 publication that the engine and dLocal actually use), add a unique constraint on date and currency.
- Export ingestion: deduplicate fully identical rows on input (PayPal US, dLocal), validate the date window on read (PayPal EU).
- PayPal: raise a query on the date format in the EU statement, three month-day rows inside a day-month file.
- Adyen and Google Play: fee claim, 2 and 6 payments at double the rate.
- dLocal: question on the fee charged on rejected payments, 68.40 for the month.

Summary

Row-level detail is in marts.recon_pairs; the per-provider walkthrough follows below.

Discrepancies by provider

psp	row_count	discrepancy_rows	abs_usd	signed_usd	share_pct
dlocal	1280	10	200708.29	-200693.05	99.85
adyen	1738	7	137.73	-115.95	0.07
paypal_eu	1833	6	125.64	-125.64	0.06
paypal_us	2092	2	34.98	34.98	0.02
google_play	776	0	0	0	0
total	7719	25	201006.64	-200899.66	100

Of 7,719 pairs in June, 25 mismatch, and almost the whole gap, 99.85%, sits with dLocal, where the engine shows 200 thousand more than the provider on a turnover of 15 thousand. The other four providers together give 298 dollars by absolute value; Google Play reconciles to the cent. Every dollar of difference between the engine and the providers is assigned to a cause; nothing is unexplained, the residual is 0 for every provider and in total. Share percentages are computed on absolute USD.

Discrepancies by provider and cause

psp	cause_bucket	cause	row_count	abs_usd	signed_usd	share_pct	share_in_psp_pct
adyen	explained	missing_in_engine	2	75.65	-53.93	0.04	54.93
adyen	explained	amount_mismatch	2	40.36	-40.36	0.02	29.3
adyen	explained	status_mismatch	1	10.9	-10.9	0.01	7.91
adyen	explained	period_cutoff	1	10.79	-10.79	0.01	7.83

psp	cause_bucket	cause	row_count	abs_usd	signed_usd	share_pct	share_in_psp_pct
dlocal	explained	missing_at_provider	1	7.42	-7.42	0	0
dlocal	explained	amount_mismatch	1	7.36	-7.36	0	0
dlocal	explained	duplicate_row_in_export	1	7.13	7.13	0	0
dlocal	explained	status_mismatch	1	6.45	-6.45	0	0
dlocal	explained	provider_fx_rate	3	0.49	0.49	0	0
dlocal	matched	matched	1161	0	0	0	0
dlocal	matched	matched_declined	109	0	0	0	0
google_play	matched	matched	776	0	0	0	0
paypal_eu	explained	missing_in_engine	2	92.35	-92.35	0.05	73.5
paypal_eu	explained	provider_date_format	3	32.73	-32.73	0.02	26.05
paypal_eu	explained	engine_fx_date_error	1	0.56	-0.56	0	0.45
paypal_eu	matched	matched	1681	0	0	0	0
paypal_eu	matched	matched_declined	146	0	0	0	0
paypal_us	explained	status_mismatch	1	24.99	24.99	0.01	71.44
paypal_us	explained	duplicate_row_in_export	1	9.99	9.99	0	28.56
paypal_us	matched	matched	1932	0	0	0	0
paypal_us	matched	matched_declined	158	0	0	0	0

Each of the 25 mismatching pairs has a cause; there is no unexplained residual. One cause, the engine FX error on three dLocal payments, gives 99.84% of the discrepancy. The other fifteen provider × cause lines (22 pairs) are isolated cases: chargebacks and refunds missing in the engine, duplicated export rows, disputed statuses and the month boundary, each worth tens of dollars or less.

Assumptions

- The period is June 2026 in UTC: by capture time in the engine (by creation time for declined and pending rows, which have no capture time) and by event time at the provider.
- Money is counted only where it actually moved: settled in the engine, Completed / PAID / Settled / Charge at the provider; declined, pending, Refused, REJECTED and IN_MEDIATION count as zero.
- Provider USD: the provider's own figure where it exists (dLocal, Google Play), otherwise the rate table on the row date, last available rate on or before that date (PayPal EU, Adyen).
- Difference = provider minus engine.
- Duplicates, a different rate, the month boundary and flipped dates are not fixed but shown as causes.
- Adyen: a sale is dated by its Settled row; refunds are paired by order_id and type.
- Google Play: pairs by time, product and type; there is no key.

Data-quality findings

Engine

- FX rate of 1 on three dLocal payments (DL-90001311 BRL, DL-90001312 MXN, DL-90001313 COP): the local amount was written as USD, 200,788.90 instead of 109.46. This single error is 99.84% of the month's discrepancy.
- Wrong rate date on two payments: TXN-107950 (PayPal EU, June 16, rate of June 2, -0.56) and TXN-107951 (Adyen, June 11 09:26, rate of June 10, +0.03). The rule "last available rate on the transaction date" holds in the other 503 cases.
- Chargebacks do not arrive: for PayPal EU the engine has no CHARGEBACK record at all against one Payment Reversal at the provider (ORD-507788, -59.99 EUR); for Adyen two records against three at the provider (ORD-507808 is missing).
- Authorised amount instead of captured amount: ORD-507792 and ORD-507793 are booked as 59.99 EUR and 21.99 GBP, Adyen captured 35.99 EUR and 11.00 GBP.
- Payments the provider does not have or has rejected or disputed: TXN-107989 (dLocal, 6,990 CLP, no record at dLocal), TXN-107959 (Adyen, 9.99 EUR, Refused at Adyen), DL-90001310 (dLocal, 34.90 BRL, IN_MEDIATION at dLocal).
- Provider payment absent from the engine: ORD-507811 (Adyen, Authorised and Settled). Refund without an engine record: ORD-507806 (PayPal EU, -24.99 EUR).
- Status never synced: one row, TXN-107960 (PayPal US, 24.99), is still pending in the engine while the provider completed it 25 minutes after creation, well inside the usual capture delay of 5–110 minutes.
- Different partial-refund amounts: ORD-507807 (dLocal), engine 59.97 BRL, provider 99.95 BRL.

Rate table

- Two BRL rows for 2026-06-10, 0.185352 and 0.190542. The engine uses the second one in 23 cases and the first one in a single case (TXN-107952, dLocal DL-90001308); dLocal uses the second one. Difference on that one payment 0.47.

Provider exports

- Fully duplicated rows: PayPal US (DAB2MG8NSYNB3UXDY, 9.99) and dLocal (DL-90001316, 129 MXN). The engine has one record each; the money moved once.
- PayPal EU: three dates in month-day format inside a day-month file (06/03, 06/09, 06/12/2026); on read they drift to March, September and December. The sales happened on June 3, 9 and 12; the engine confirms it to the second.
- dLocal: two rows where `usd_amount` differs from `local_amount / fx_rate` by one cent (two ARS sales of 15,999).
- dLocal: a fee is charged on all 109 rejected payments of June, 68.40 USD.
- Google Play: the June file is cut by Los Angeles time; after conversion to UTC its last row lands on July 1 03:19 and leaves the reporting period (the matching engine row is captured on July 1 as well).
- Adyen: one payment (ORD-507794, 9.99 EUR) is Settled four days after capture, on July 2; the other 1,617 settle on the capture day.
- Fees off contract: Adyen two rows at 4.4% instead of 2.5% (ORD-507798, ORD-507799; overpaid 1.14 EUR and 0.48 USD, 1.72 USD in total); Google Play six rows on June 17 at 30% instead of 15% (overpaid 9.00 USD).

Engine overview

Taxonomy

The engine key is `txn_id`; `order_id` links a sale with its refund. `amount_usd` is unsigned. Operation types: SALE, REFUND, CHARGEBACK. Statuses: settled, declined, pending; the last two occur only on SALE. Revenue = sum over all settled rows, SALE positive, REFUND and CHARGEBACK negative (signed `amount_usd`). Pairs by `order_id` are not netted, but a test guarantees that every refund has a settled sale. declined and pending are excluded from revenue but stay in the summary rows.

Applying the taxonomy to the engine and deriving revenue, dLocal immediately stands out as dominant, which is unexpected for a Latin America account; most likely a currency problem.

psp	sales	reversals	net_usd	sum_net_usd	share_usd
dlocal	1152	18	215642.53	335668.57	64.24
paypal_eu	1660	25	36323.01	335668.57	10.82
paypal_us	1893	39	36046.31	335668.57	10.74
adyen	1577	26	32912.09	335668.57	9.8
google_play	766	10	14744.63	335668.57	4.39

The distribution shows outliers at dLocal:

psp	count	mean	std	min	25%	50%	75%	max
adyen	1577	21.14	19.36	4.99	10.79	10.91	27.16	71.63
dlocal	1152	187.37	5889.26	2.15	6.42	7.14	16.61	199900

psp	count	mean	std	min	25%	50%	75%	max
google_play	766	19.49	18.14	3.08	9.99	10.86	24.99	71.4
paypal_eu	1660	22.18	19.84	5.39	10.86	10.94	27.23	71.63
paypal_us	1893	19.39	17.59	4.99	9.99	9.99	24.99	59.99

The outlier at dLocal is obvious on the distribution chart (see the PDF). Since the task is to find discrepancies, the FX rates are not checked up front: first compare with the source, then look for the cause, FX rates included.

Reconciliation with PayPal US

Direction of the difference: provider minus engine, a plus means the provider has more.
PayPal US. Key is Transaction ID, unique up to one full duplicate. Invoice ID is the engine order_id; on a refund, Reference Txn ID points to the Transaction ID of the original payment. Type has two values: Website Payment, Refund. Status has three: Completed, Denied, Refunded. Three combinations: Website Payment / Completed, Website Payment / Denied, Refund / Refunded. Amounts Gross, Fee, Net; the sign is embedded, Gross is negative on Refund, Fee ≤ 0, Net = Gross + Fee, Net = 0 on Denied. Net revenue = sum of Gross over rows with Status <> 'Denied'. Single currency, USD. Date in MM/DD/YYYY, Time separate, Time Zone always GMT.

Applying the taxonomy and deriving revenue:

sales	reversals	net_usd
1895	39	36081.29

Difference with the engine: 36081.29 – 36046.31 = 34.98

cause	rows	engine_usd	provider_usd	diff_usd
duplicate_row_in_export	1	0	9.99	9.99
matched	1932	36046.31	36046.31	0
matched_declined	158	0	0	0
status_mismatch	1	0	24.99	24.99

- matched: 1,932 rows, 36,046.31 on both sides, difference 0.
- matched_declined: 158 rows, no money on either side.
- duplicate_row_in_export: 1 row, +9.99.
- status_mismatch: 1 row, +24.99: pending in the engine, Completed at PayPal.

PayPal US revenue in the system is understated by 24.99, and there is a customer who paid and may not have received the subscription. Duplicate in the PayPal US statement: transaction DAB2MG8NSYNB3UXDY of June 11, 9.99, appears as two identical rows. The engine has one record; the money was charged once.

In substance the real discrepancy is 24.99: money that arrived on the account and is not booked by the engine. The remaining 9.99 is an export artefact with no money movement behind it; it

should not be on the PayPal account.

Reconciliation with PayPal EU

PayPal EU. Same statement layout as US, the same 13 columns. Key is Transaction ID, unique, no duplicates: 1,893 rows, 1,893 identifiers. Invoice ID is order_id, Reference Txn ID is filled on 42 rows and points to the original payment. Type has three values: Website Payment, Refund, Payment Reversal. Status has four: Completed, Denied, Refunded, Reversed. Four combinations: Website Payment / Completed, Website Payment / Denied, Refund / Refunded, Payment Reversal / Reversed. The last is a single row, EUR -59.99, a chargeback in PayPal terms. Amounts Gross, Fee, Net with a decimal comma, sign embedded: refund and reversal negative, Fee ≤ 0 , 0.00 on Denied and Refund. Net revenue = sum of Gross over Status <> 'Denied'. Two currencies, EUR and GBP; no rate in the statement, the engine computes USD itself. Date in DD/MM/YYYY, day first, unlike US. Time separate, Time Zone always GMT. Encoding cp1252.

Applying the taxonomy and deriving revenue:

sales (incl. Denied)	reversals	net_usd
1803	27	36197.37

Difference with the engine: $36197.37 - 36323.01 = -125.64$

cause	n	engine_usd	provider_usd	diff_usd
engine_fx_date_error	1	65.75	65.19	-0.56
matched	1681	36224.53	36224.53	0
matched_declined	146	0	0	0
missing_in_engine	2	0	-92.35	-92.35
provider_date_format	3	32.73	0	-32.73

- matched: 1,681 rows, 36,224.53 on both sides, difference 0.
- matched_declined: 146 rows, no money on either side.
- missing_in_engine: 2 rows, -92.35: Payment Reversal -59.99 EUR on ORD-507788 and Refund -24.99 EUR on ORD-507806 exist at PayPal; the engine has no records.
- provider_date_format: 3 rows, -32.73: sales of 9.99 EUR on June 3, 9 and 12 are written in the statement as 06/03, 06/09, 06/12 in month-day format inside a day-month file; on read they drift to March, September and December.
- engine_fx_date_error: 1 row, -0.56: TXN-107950, sale of June 16, the engine applied the June 2 rate.

PayPal EU revenue in the system is overstated by 92.35: PayPal returned money to two customers and the engine does not see it. The chargeback on ORD-507788 matters most: the engine has no CHARGEBACK record at all for PayPal EU, so such events never reach it. Three sales with flipped dates: the money arrived in June, the engine and the statement time confirm it to the second; the defect is in the PayPal export. The rate on TXN-107950 is the only deviation from the engine rule "last available rate on the transaction date"; damage 0.56.

In substance the real discrepancy is -92.35: money that left the account and is not booked by

the engine. The remaining -32.73 is an export artefact; the sales were in June. -0.56 is an engine FX error, pennies, but a systematic check is needed.

Reconciliation with dLocal

Taxonomy

dLocal. Key is transaction_id of the form DL-9000xxxx, which is the engine psp_reference, unique up to one full duplicate: 1,319 rows, 1,318 identifiers, DL-90001316 twice. invoice_id is order_id. transaction_type has two values: PAYMENT, REFUND. status has four: PAID, REJECTED, IN_MEDIATION, REFUNDED. Four combinations: PAYMENT / PAID, PAYMENT / REJECTED, PAYMENT / IN_MEDIATION (one row, BRL, a dispute), REFUND / REFUNDED. In engine terms: SALE settled, SALE declined, SALE pending, REFUND settled. No chargebacks. Five currencies: ARS, BRL, CLP, COP, MXN. local_amount is in minor units, divisor $10^{\text{currency_exponent}}$: CLP has exponent 0, the others 2, so 12900 MXN is 129.00. fx_rate is "local units per 1 USD", the inverse of the rate table. $\text{usd_amount} = \text{local_amount} / 10^{\text{exp}} / \text{fx_rate}$; the arithmetic holds on every row except two, by one cent. fee_usd is in dollars. The sign is not embedded: local_amount and usd_amount are positive for both PAYMENT and REFUND, so the sign has to be set from transaction_type. REFUND rows carry a fee of 0.00. REJECTED rows carry a non-zero fee, all 111 rows in the file. created_at_utc is already ISO and UTC, a single column. Window June 1 – July 3.

Applying the taxonomy and deriving revenue:

sales	reversals	net_usd
1151	18	14949.48

Difference with the engine: $14949.48 - 215642.53 = -200693.05$

cause	n	engine_usd	provider_usd	diff_usd
amount_mismatch	1	-11.04	-18.4	-7.36
duplicate_row_in_export	1	0	7.13	7.13
engine_fx_rate_error	3	200788.9	109.46	-200679.44
matched	1161	14807.34	14807.34	0
matched_declined	109	0	0	0
missing_at_provider	1	7.42	0	-7.42
provider_fx_rate	3	43.46	43.95	0.49
status_mismatch	1	6.45	0	-6.45

- matched: 1,161 rows, 14,807.34 on both sides, difference 0.
- matched_declined: 109 rows, no money on either side.
- engine_fx_rate_error: 3 rows, -200,679.44: sales DL-90001311 (89.90 BRL, June 9), DL-90001312 (799 MXN, June 15) and DL-90001313 (199,900 COP, June 22) are booked in the engine with a rate of 1, the local amount became the USD amount: 89.90, 799.00

and 199,900.00 instead of 16.60, 44.08 and 48.78 at dLocal. The rate table gives the same 16.60, 44.08 and 48.78.

- missing_at_provider: 1 row, -7.42: TXN-107989 on ORD-507812, sale of 6,990 CLP on June 20, settled in the engine, no record at dLocal.
- amount_mismatch: 1 row, -7.36: refund on ORD-507807 (sale of 199.90 BRL). The engine refunded 59.97 BRL, 30% of the sale; dLocal refunded 99.95 BRL, 50%.
- duplicate_row_in_export: 1 row, +7.13: DL-90001316, sale of 129 MXN on June 19, two identical rows in the dLocal export.
- provider_fx_rate: 3 rows, +0.49: local amounts equal, USD differs. DL-90001308, 89.90 BRL on June 10, +0.47: the rate table has two BRL rates for June 10, 0.185352 and 0.190542; the engine took the first, dLocal the second. Two ARS sales of 15,999, +0.01 each: same rate, rounding difference.

dLocal revenue in the system is overstated by 200,693.05 against a real turnover of 14,942.35 (14,949.48 in the export including the duplicated row). Almost all of it is three sales with a rate of 1: the engine booked the local amount as dollars, and 199,900 Colombian pesos became 199,900 dollars. This is not a discrepancy with the provider but a conversion error inside the engine, 13 times the whole monthly dLocal revenue. Without it the difference with dLocal is -13.61 and consists of isolated cases: a sale the provider does not have, a refund for a different amount, a dispute with money held, a duplicated export row and FX pennies. The duplicated BRL rate for June 10 in the rate table shows up here as well: the engine and dLocal took different rows of the two.

In substance the real discrepancy is -21.23: a sale with no trace at the provider (-7.42), a refund where dLocal returned more to the customer than the engine knows (-7.36) and a dispute (-6.45) where the engine counts the money as received while the provider holds it. +7.13 is an export artefact; there was one sale. +0.49 is FX, pennies, but the two rows for one date in the rate table must go. And separately -200,679.44: the rate of 1 in the engine, the first action item.

Reconciliation with Adyen

Taxonomy

Adyen. Key is Psp Reference; one payment is several rows, one per event; Merchant Reference = engine order_id. Refund and chargeback go under the Psp Reference of the original payment with no number of their own, while in the engine REFUND and CHARGEBACK have their own psp_reference, so for them the key is Merchant Reference + type. Event type Record Type: Authorised, Settled, Refused, Refunded, Chargeback. There is no separate status; the status is the type itself: Refused = declined, Settled = money arrived. Amounts are unsigned in a pair of columns, exactly one filled: Gross Credit on Authorised, Settled, Refused; Gross Debit on Refunded, Chargeback. Revenue = sum of Gross Credit on Settled minus Gross Debit on Refunded and Chargeback. Authorised is not revenue, it is the same payment before settlement; Refused is not revenue but stays in the summary rows. Fee Commission + Markup only on Settled; the contract is 2.5% for both accounts. Currency Gross Currency: EUR, GBP on LumoECOM_EU, USD on LumoAPP_US; no rate in the file. Creation Date is in Europe/Amsterdam; converted to UTC by us.

sales	reversals	net_usd
1576	27	32796.14

Difference with the engine: 32796.14 – 32912.09 = –115.95

cause	n	engine_usd	provider_usd	diff_usd
amount_mismatch	2	93.79	53.43	-40.36
fx_date_lag	1	28.34	28.37	0.03
matched	1598	32768.27	32768.27	0
matched_declined	133	0	0	0
missing_in_engine	2	0	-53.93	-53.93
period_cutoff	1	10.79	0	-10.79
status_mismatch	1	10.9	0	-10.9

- matched: 1,598 rows, 32,768.27 on both sides, difference 0.
- matched_declined: 133 rows, no money on either side.
- missing_in_engine: 2 rows, -53.93: Chargeback -59.99 EUR on ORD-507808 of June 26 and a payment of 9.99 EUR on ORD-507811 of June 16 (Authorised and Settled at Adyen) are in the report; the engine has no records.
- amount_mismatch: 2 rows, -40.36: ORD-507792 authorised 59.99 EUR, captured 35.99 EUR; ORD-507793 authorised 21.99 GBP, captured 11.00 GBP. The engine booked the authorised amount; Adyen captured less, a partial capture.
- status_mismatch: 1 row, -10.90: TXN-107959 on ORD-507785, 9.99 EUR of June 8, settled in the engine with capture time 12:39; at Adyen the only row is Refused at 11:00.
- period_cutoff: 1 row, -10.79: ORD-507794, 9.99 EUR, captured in the engine on June 28, Settled at Adyen on July 2. The only payment whose Settled is not on the capture day; the other 1,617 settle the same day.
- fx_date_lag: 1 row, +0.03: TXN-107951, 21.99 GBP of June 11 09:26, the engine applied the June 10 rate although neighbouring payments of the same morning got the June 11 rate.

Adyen revenue in the system is overstated by 115.95. Two payments are booked in the engine at the authorised amount while Adyen captured less, -40.36, the second largest item. The engine does not see the chargeback on ORD-507808, as in PayPal EU: for Adyen the engine has two CHARGEBACK records against three at the provider. Payment ORD-507811 went through at Adyen, the money arrived, and the engine has no record of it at all, the only case this month where the provider knows more than the engine on the plus side. TXN-107959 is captured according to the engine; Adyen refused it, no money arrived.

In substance the real discrepancy is -105.19: under-captured amounts (-40.36), the chargeback (-64.79), the refusal (-10.90) and the unbooked payment (+10.86). The remaining -10.79 is the month boundary: the money arrived, Adyen settled it on July 2, here the engine is right. +0.03 is FX, pennies, but together with TXN-107950 from PayPal EU it is the second case of the engine taking the wrong day. Fees on the 1,576 June Settled rows are 2.50% on all accounts, on contract; the exceptions are two rows at 4.4%, ORD-507798 and ORD-507799, overpaid 1.14 EUR and 0.48 USD, 1.72 USD in total.

Reconciliation with Google Play

Taxonomy

Google Play. Two files of one report, June and a partial July (July 1–3); the first line of each file is a header with the merchant account LumoPlayMain and the timezone, the columns start on the second line. There is no key: neither psp_reference nor order_id; in the engine psp_reference is empty for google_play. A row is identified only by Transaction Date + Transaction Time + Product ID; for Charge that triple is unique (767 of 767). Row type Transaction Type: Charge, Google fee, Charge refund. Charge and Google fee come in pairs with the same time and product, 767 = 767; the fee is a separate row, not a column. Charge refund is a separate row with its own time, 10 in June, 8 in July. There are no declines in the report at all, only money that moved. Amounts are signed: Charge positive, Google fee and Charge refund negative. Two currencies per row: Buyer Currency (USD, EUR, GBP, BRL, MXN) with Amount (Buyer Currency) and Merchant Currency, always USD, with Amount (Merchant Currency); between them Currency Conversion Rate, Google's USD per unit of buyer currency. Revenue = sum of Amount (Merchant Currency) over Charge and Charge refund; Google fee is not revenue, it is the fee, contract 15%. Products: sub_monthly, sub_quarterly, sub_annual, coach_addon; Buyer Country US, DE, GB, BR, MX. Transaction Date looks like "Jun 1, 2026" plus Transaction Time, both in America/Los_Angeles; converted to UTC by us.

sales	reversals	net_usd
766	10	14744.63

Difference with the engine: $14744.63 - 14744.63 = 0$

However, six payments on June 17 are charged 30% instead of 15%. The money is real: Lumo will receive 9.00 less on the payout.
