

## June 2026 revenue. Note for the CFO

Lumo Wellness. 10 September 2026. All amounts in USD. Revenue is net of refunds and chargebacks, before fees; payout is after fees. Provider-by-provider detail, SQL, tests and CSV exports: [github.com/kidspsy/lumo-payments-recon](https://github.com/kidspsy/lumo-payments-recon), report [Payments reconciliation.pdf](#).

**June revenue is 134,795: sales of 136,916 less refunds and chargebacks of 2,121. Payout to our accounts is 127,126 after fees of 7,669, or 5.6% of sales.** The figure is confirmed against the statements of five payment providers: 7,719 transactions matched one to one, unexplained residual 0. It is safe to close the month and make decisions on it.

In BI our system shows 335,669 for June, 200,874 more. That is an FX booking error on three dLocal payments, not real money; the breakdown is in section 3 of this note.

### 1. What we earned

Three quarters of revenue come through PayPal and Adyen; dLocal and Google Play bring 11% each. Refunds are 1.5% of sales, between 1.2% and 1.8% by source.

| Source       | Sales, count | Sales          | Refunds and chargebacks | Revenue        | Share of revenue | Fees         | Fees, %    | Payout         |
|--------------|--------------|----------------|-------------------------|----------------|------------------|--------------|------------|----------------|
| PayPal EU    | 1,660        | 36,812         | -582                    | 36,230         | 26.9%            | 1,698        | 4.6        | 34,533         |
| PayPal US    | 1,894        | 36,721         | -650                    | 36,071         | 26.8%            | 2,208        | 6.0        | 33,863         |
| Adyen        | 1,577        | 33,290         | -484                    | 32,807         | 24.3%            | 831          | 2.5        | 31,976         |
| dLocal       | 1,150        | 15,162         | -220                    | 14,942         | 11.1%            | 683          | 4.5        | 14,259         |
| Google Play  | 766          | 14,930         | -186                    | 14,745         | 10.9%            | 2,249        | 15.1       | 12,495         |
| <b>Total</b> | <b>7,047</b> | <b>136,916</b> | <b>-2,121</b>           | <b>134,795</b> | <b>100%</b>      | <b>7,669</b> | <b>5.6</b> | <b>127,126</b> |

Revenue counts only money that actually moved: declined and pending payments and open disputes are excluded. Fees are the amounts actually charged, in USD at the rate on the transaction date; Adyen and Google Play match their contracts, PayPal and dLocal have no contract on file.

### 2. What to know about this figure

- **Fee overcharge of 10.72, to be claimed from the providers.** Google Play charged 30% instead of 15% on six sales on 17 June (9.00); Adyen charged 4.4% instead of 2.5% on two sales (1.72). Every other contracted fee matches to the cent.
- **dLocal fees on declined payments, 68.40, open question.** The provider's statement shows the same 4.5% rate on 109 declined payments in June as on successful ones, although no money moved. Whether it was actually charged is not visible in the statement; there is no contract. Needs a query to the provider; not included in fees or payout.
- **A customer paid; check that the subscription is active.** PayPal US, 24.99, payment completed on 12 June, still pending in our system. Included in revenue.
- **dLocal dispute of 6.45 is not included.** The payment is in dispute at the provider as of the report date; our system counts it as received. It enters revenue once the dispute closes in our favour; its fee of 0.29 is likewise excluded.

### 3. If you have seen the figures in BI (engine logs)

Our payment system, the data source for BI, shows 335,669 for June, 2.5 times the real revenue.

**This is a booking error, not lost money.** Three dLocal sales were recorded without currency conversion: a rate of 1.0 was applied, the local amount landed in the USD column, and a 48.78 sale became a 199,900 sale. In total 200,679 of excess revenue, 99.9% of the gap to BI; because of it dLocal looks like 64% of the business in BI instead of 11%. The remaining 194 net is 13 transactions: chargebacks and refunds that never reach our system, and one-off status and amount errors. All of this is already corrected in the figures of section 1.

| Source       | In BI          | Real revenue   | Difference      | %             | Cause                                                                                        |
|--------------|----------------|----------------|-----------------|---------------|----------------------------------------------------------------------------------------------|
| dLocal       | 215,643        | 14,942         | -200,701        | -93.1%        | three sales without currency conversion, a dispute, a refund, a sale with no trace at dLocal |
| Adyen        | 32,912         | 32,807         | -105            | -0.3%         | a chargeback, two partial captures, a refusal, a payment our system never saw                |
| PayPal EU    | 36,323         | 36,230         | -93             | -0.3%         | a chargeback and a refund missing in our system                                              |
| PayPal US    | 36,046         | 36,071         | +25             | +0.1%         | payment completed, still pending in our system                                               |
| Google Play  | 14,745         | 14,745         | 0               | 0.0%          | matches to the cent; fee overcharge of 9.00, section 5                                       |
| <b>Total</b> | <b>335,669</b> | <b>134,795</b> | <b>-200,874</b> | <b>-59.8%</b> | <b>25 transactions out of 7,719, all explained</b>                                           |

Percent of the BI figure. Any report, forecast or LatAm unit economics built directly on June system data needs to be recalculated.

#### 4. What the discrepancy consists of

7,719 transactions were matched one to one: 7,694 agree to the cent, 25 differ, each with a cause found, unexplained residual 0.00. Against the provider statements our system shows 200,900 more; against real revenue 200,874, because on 26 dollars our system is right and the statement is wrong (duplicated rows, flipped dates, a payment on the month boundary). Below, the difference is provider minus system; the share is of the sum of absolute discrepancies. The full provider × cause summary (rows, absolute and signed USD, share): [recon\\_summary.csv](#) in the repository.

| Cause          | Where  | Transactions | Absolute   | Signed      | Share  |
|----------------|--------|--------------|------------|-------------|--------|
| Rate of 1.0 in | dLocal | 3            | 200,679.44 | -200,679.44 | 99.84% |

| Cause                                                                     | Where                    | Transactions | Absolute          | Signed             | Share       |
|---------------------------------------------------------------------------|--------------------------|--------------|-------------------|--------------------|-------------|
| our system<br>(section 3)                                                 |                          |              |                   |                    |             |
| Chargeback, reversal, refund and payment missing in our system            | PayPal EU, Adyen         | 4            | 168.00            | -146.28            | 0.08%       |
| Amount in our system differs from what the provider charged               | Adyen, dLocal            | 3            | 47.72             | -47.72             | 0.02%       |
| Status in our system differs from the provider: pending, refused, dispute | PayPal US, Adyen, dLocal | 3            | 42.34             | +7.64              | 0.02%       |
| Date in the export in month/day format                                    | PayPal EU                | 3            | 32.73             | -32.73             | 0.02%       |
| Row duplicated in the export                                              | PayPal US, dLocal        | 2            | 17.12             | +17.12             | 0.01%       |
| Settled by the provider after month end                                   | Adyen                    | 1            | 10.79             | -10.79             | 0.01%       |
| Sale in our system, no trace at the provider                              | dLocal                   | 1            | 7.42              | -7.42              | 0.00%       |
| Rate from the wrong date or a different rate, cents                       | PayPal EU, Adyen, dLocal | 5            | 1.08              | -0.04              | 0.00%       |
| <b>Total discrepancies</b>                                                |                          | <b>25</b>    | <b>201,006.64</b> | <b>-200,899.66</b> | <b>100%</b> |

After the FX error there is one systemic theme: **chargebacks, reversals and refunds initiated on the provider side do not reach our system**. The rest are isolated cases.

## 5. Fees against contract

Only Adyen (2.5%) and Google Play (15%) have a contract on file. Of 2,342 contracted rows, eight are off contract: Google Play charged 30% on six sales on 17 June (overcharge 9.00), Adyen 4.4% on two sales (1.72); the rest match to the cent. PayPal effectively charges 6.0% in the US and 4.6% in the EU, dLocal 4.5%; there are no contracts, nothing to check against. dLocal shows a fee of 68.40 on 109 declined payments at the same rate as on successful ones; whether it was actually charged is not visible in the statement.

## 6. What to do

1. **Finance, now.** Close June at 134,795. Recalculate the reports and forecasts built directly on system data.
2. **Finance and providers.** Claims to Google Play for 9.00 and to Adyen for 1.72, a query to dLocal on 68.40. Put the PayPal and dLocal tariffs on paper, otherwise there is nothing to check them against.
3. **Payments team, critical.** Forbid a rate of 1.0 for any currency other than USD and check the applied rate against the rate table. Correct the three dLocal payments: this closes 99.9% of the gap to BI.
4. **Payments team.** Ingest chargebacks, reversals and refunds from PayPal and Adyen. Take the captured amount from Adyen, not the authorised one. Sync statuses: pending older than an hour, refusals, disputes.
5. **Data.** Remove the first BRL rate for 10 June from the rate table (0.185352, superseded by the second) and forbid two rates for one date. When loading exports, drop fully duplicated rows and validate the PayPal EU date window.

## 7. Assumptions: how the data was read

Each source is translated into one language: sale, refund, chargeback, refusal. Only money that actually moved counts; everything else is zero on both sides. The period is June 2026 in UTC.

| Source      | Matching key                                        | Money: plus / minus                                       | Zero                      | USD                                                           | Time                          |
|-------------|-----------------------------------------------------|-----------------------------------------------------------|---------------------------|---------------------------------------------------------------|-------------------------------|
| Our system  | txn_id; the order number links a sale to its refund | settled SALE / REFUND, CHARGEBACK                         | declined, pending         | own USD column                                                | UTC, capture time             |
| PayPal US   | Transaction ID, Invoice ID = order number           | Payment Completed / Refund                                | Denied                    | USD                                                           | GMT                           |
| PayPal EU   | same                                                | Payment Completed / Refund, Payment Reversal (chargeback) | Denied                    | EUR, GBP at the rate table on the transaction date            | GMT, day/month dates          |
| dLocal      | transaction_id = reference in our system            | PAYMENT PAID / REFUND; sign set by type                   | REJECTED, IN_MEDIATION    | own USD column, rate checked against the rate table           | UTC                           |
| Adyen       | Psp Reference, by event row                         | Settled / Refunded, Chargeback; Authorised is not money   | Refused                   | USD as is; EUR, GBP at the rate table on the transaction date | Amsterdam, converted to UTC   |
| Google Play | no key: time + product + type                       | Charge / Charge refund; Google fee is a separate fee row  | no refusals in the report | own USD column, rate checked against the rate table           | Los Angeles, converted to UTC |

The difference is always provider minus system. Export defects are not silently fixed but shown as causes. Real revenue takes the side that is right: our system on duplicates, dates and the month boundary; the provider on FX errors inside our system, chargebacks, statuses and amounts.

## 8. Data quality and reliability of the calculation

- **Rate table.** Two BRL rates for 10 June: our system takes one in 23 cases and the other in one, dLocal the second. In two transactions out of 505 our system applied the rate of the wrong date; in the rest the rule "last rate on the transaction date" holds.
- **PayPal EU.** The file comes in a different encoding, with a different delimiter and day/month dates, unlike PayPal US; three dates inside the file are in month/day format and drift to March, September

and December on reading.

- **Google Play.** No transaction id in the report or in our system; matched by time, product and type, 776 of 776 agree. The month is cut by California time; the last June row moves to July after conversion to UTC.
- **dLocal.** A fee is shown on all 109 refusals. Amounts are unsigned, the sign comes from the transaction type. The FX arithmetic "local amount / rate = USD" holds on every row except two, by one cent.
- **Adyen.** One payment is several event rows; chargebacks and refunds have no number of their own and are matched by order number. One payment settled four days after capture, the other 1,617 on the same day.
- **Reliability.** The reconciliation is a reproducible calculation in DuckDB and dbt: every transaction is matched to a provider record one to one, and the identities "matched + explained + unexplained = difference" and "revenue = system + correction" are checked automatically, 369 checks in total. The SQL (dbt models and tests) and the CSV exports are in the repository: [github.com/kisdspy/lumo-payments-recon](https://github.com/kisdspy/lumo-payments-recon), all SQL is DuckDB.
